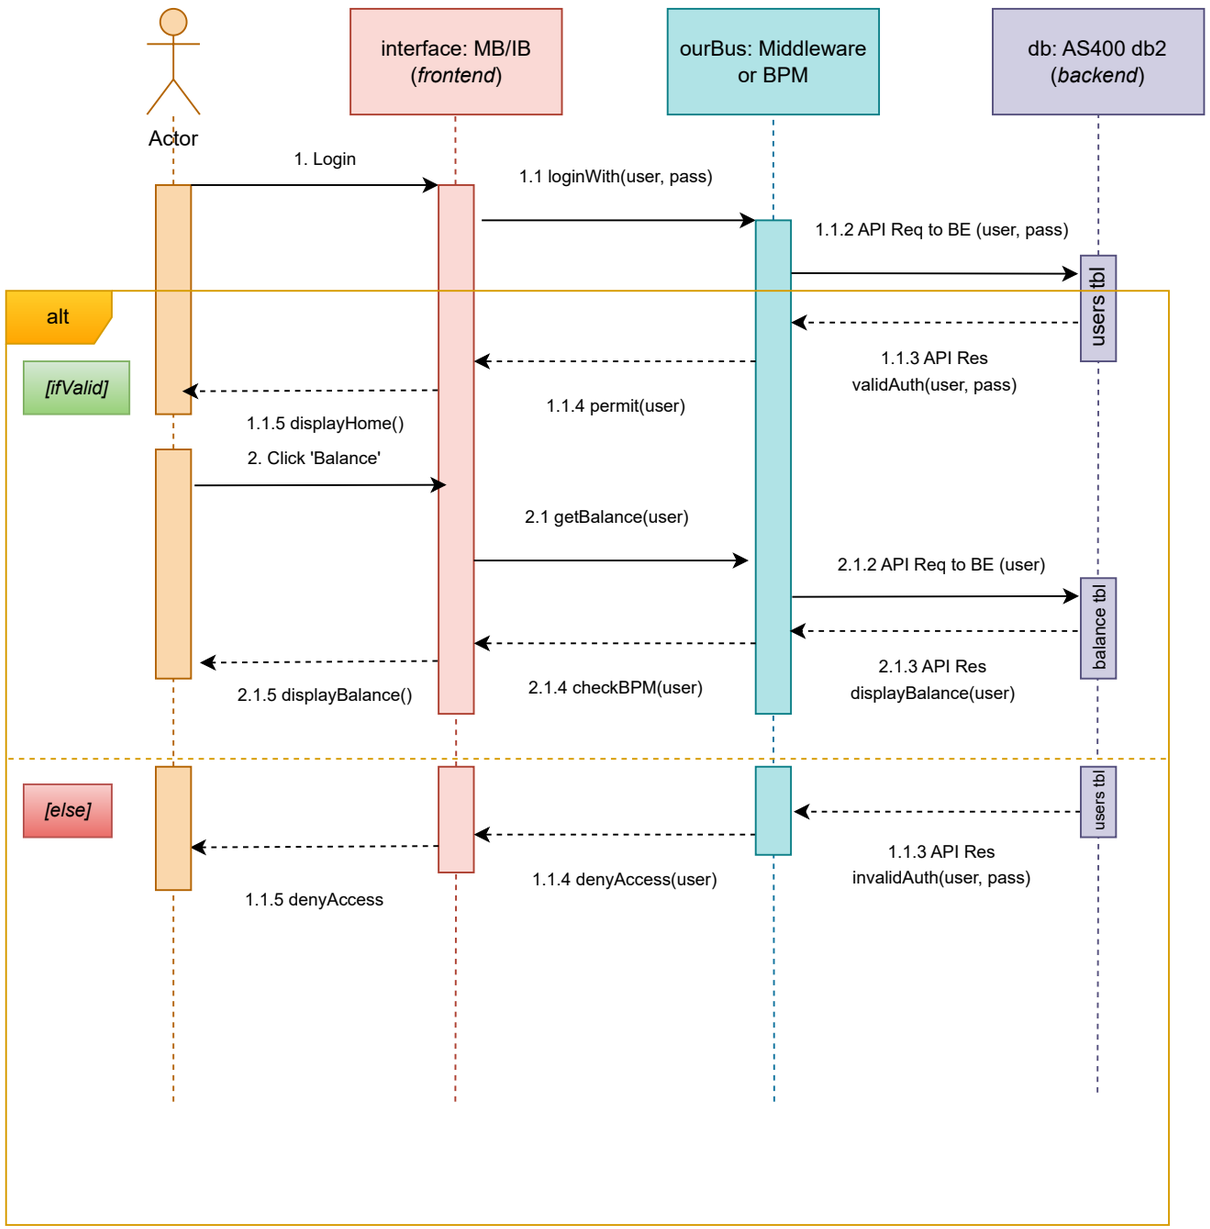
Assignment task - banking ops

Please note that I will not be putting security controls or firewalls or F5s or anything as this is just an idea/concept between for example the actor and interface.

Same with fail-overs plans and so on.

To add more parameters to display is also easy, we just pass it along, or just create another iteration, but why create another, just pass it along such as "Date for every transaction" "Withdrawals" "Deposits" "Loan installments payment" and so on.

To check balance we login and display information usually like any bank around the world, general information such as bank accounts and total balance will be displayed but here I'll go the extra mile to display it even if it's not being displayed.



Case 1 (Automation) [Sanity check x1000 logins]

Case 2 (Automation) [1 case]

Case 3 (Automation)

Case 4 (Integration test)

To apply testing in this diagram, is very easy, it can be done by doing manual and automated jobs. The reason because while let's drawing or writing the idea/code we for code testability while doing so. Either by using code, katalon, python, macro recording, selenium, dwight and many other automation tools.
